Grow exceptional plants. Reduce landfill waste. Minimize greenhouse gases.  
**...and that's just the start!**

## Save Money!

**Landfills are toxic.  
Stop contributing to greenhouse gases!**

Reduce landfill waste by recycling all of your food scraps including those not allowed in composting with a Bokashi Cyclette. Landfills are toxic, foul smelling, bad for the planet. They release tons of carbon dioxide and methane gas into the atmosphere and heat up the planet... and it is costing you a lot.

**Our soil needs help.  
You can make a difference!**

Pollution is killing our atmosphere and our soil. Fermenting your food scraps with Bokashi is better and faster than composting and far less toxic. Use our Bokashi system to restore the nutrients (nitrogen, and other essential components) to soil and make plants grow at an accelerated rate.

**Ferment your food scraps! Save the world!**

Our Bokashi Cyclette is simple to use. A system uses 2 anaerobic fermenters with a starter supply of Bokashi culture mix. Your food scraps make valuable nutrients for your plants. Choose your color and size.
